PITCH · SAY THIS · ABOUT 1:55

Bots trade. They don't have a brake.

VetoOS is the brake. Models propose. A deterministic engine is the only signer. The venue's own position is the only truth about a fill.

0:00 Hook

Bots and AI agents already trade Hyperliquid. What they do not have is a brake. When a model is wrong, it is still holding the key.

0:20 Problem

Same-side adds, instant retries, a local ledger that disagrees with the venue. HIP-3 multiplies the books. Closed agents ask you to trust the model.

0:50 Product

One signing process. Rules in order: freeze, market data, oracle distance, notional, leverage, daily loss, cool-down, same-side adds, rate, book depth, margin. Mismatch freezes the broker. No model can unfreeze it.

1:30 Traction

Mainnet `xyz:XYZ100` is asset `110000`. This pass, mark 30925, no 429. Testnet fills oid `62357038693` and `62357062404`. Builder-fee fill oid `62356802679`. 185 tests. The team sentence is still yours.

2:00 Close

Machines can think. Rules decide. VetoOS.

Video file: docs/media/pitch.mp4. Upload it unlisted yourself. This machine has no YouTube login.

TECHNICAL DEMO · WHAT ACTUALLY PRINTED · 1:46

Record the console yourself. The terminal run is done.

Screen recording is not available here, and `brokerd` will not start until the trading key is an agent wallet, not the operator account. The narrated cut in `docs/media/demo.mp4` uses the real command output.

Beat	What happened
Preflight	Mainnet HIP-3 read OK. Doctor RED only on key separation.
Act 1	ALLOW buy 0.00048 BTC @ 82656, oid 62357038693, ledger matched.
Act 2	Notional $9,997 denied against a $1,000 cap. `max_leverage: 999` refused. Cool-down did **not** fire: the denial was stamped at request start, and the venue read outlasted the 3s recording window. Stamp is now decision time.
Act 3	FOMO_SAME_SIDE_ADDS. Fill oid 62357062404 @ 82657.
Act 4	Tamper froze the broker (local 0.00196 vs venue 0.00096). Unfrozen afterwards with the human confirm, so the account is not stuck.
prove	`pnpm prove --receipts logs/recording` caught 4/4. Bare `pnpm prove` on the long log missed attack 1 because of a 58-line legacy prefix. Do not end the take on the bare command.
verify	Default log: VERIFIED, L2 unsigned (no receipt key), L3 unanchored tail 99. Offline recording log: unanchored tail 21.

Clean take, if you re-record

`pnpm demo:record` then `pnpm verify --receipts logs/recording` then `pnpm prove --receipts logs/recording`. That path caught every attack, including the cool-down. Use it if you do not want to risk another 429 or another real fill.

Anchor was not run. It needs `--rpc`, a gas key, and `--contract`. None of those were provided, so the unanchored tail is unchanged.
